Univariate and Bivariate Analysis - Questions Only

Univariate analysis

Q1. How many wine samples are present in each class?

Q2. What are the mean, median and standard deviation of each numerical feature?

Q3. How is alcohol content distributed across the dataset?

Q4. Which features have the greatest spread?

Q5. Are there unusual values according to the IQR method?

Q6. Is the target class distribution reasonably balanced?

Bivariate analysis

Q7. Is there a relationship between alcohol and color intensity?

Q8. How strongly are flavanoids and total phenols related?

Q9. How does proline vary across wine classes?

Q10. Do alcohol levels differ between the three classes?

Q11. Which numerical features show the strongest positive and negative correlations?

Q12. Can alcohol and proline together help distinguish the classes?

Q13. Which features have the strongest statistical association with the class label?
